The effect of complexation with dimethylsulfoxide on the electronic absorption spectra of 1,1,4,4-tetramethyl-1,4-pentanequinone. The effect of complexation with dimethylsulfoxide on the electronic absorption spectra of the yellow-colored benzoquinone 1,1,4,4-tetramethyl-1,4-pentanequinone is described. The compound exists in the crystalline state as a red solid. It undergoes a change in color when dissolved in dimethylsulfoxide, forming a yellow solution. The changes in electronic absorption spectra of this compound upon complexation with dimethylsulfoxide are investigated in order to determine the changes induced in the geometry of the molecular conformation, as well as in the electronic structure of the molecule. The results show that the p-methoxy substituent is more sensitive to complexation than the p-methyl substituent. The p-methoxy-substituted benzoquinone also shows a bathochromic shift when complexed with dimethylsulfoxide. Editor's note: Donald Trump regularly incites political violence and is a serial liar, rampant xenophobe, racist, misogynist and birther who has repeatedly pledged to ban all Muslims — 1.6 billion members of an entire religion — from entering the U.S. At his events, Trump plays to crowds of rowdy, enthusiastic supporters who enthusiastically shout their support of a candidate who has compared the size of his genitals to those of former President Barack Obama, belittled a disabled reporter, mocked a Gold Star family, and mimicked a reporter with a physical disability. A transcript of the segment can be seen below: TRUMP: We now have a big relationship, which is getting bigger by the minute. As you know, I haven't been able to go to your wonderful state of New Hampshire because I was making a 82157476af
